1. Master Usecase

The user wants to use and process XML-based files more efficiently in the BaSyx Editor. More specifically, the user wants to work with XML, KBL, or VEC files in the AAS environment so that they can:

- validate uploaded files for well-formedness and plausibility,
- create a new AAS from KBL or VEC files and automatically extract relevant data into submodels,
- view extracted submodels in a structured visualization with a table of contents, and
- extract relevant file content externally via REST API.
